

## Supplemental Materials

In these supplemental materials we report the results of three sets sensitivity analyses to the main models, and report the results of mediation models for the stay-objective versus no-instructions comparison. First, we ran the main mediation models with a control variable for general moral concern. This allowed us to test whether the positive effects of perspective taking observed in the main analyses were specific to animals and artificial entities, or whether they could be explained by an increase in general moral concern, incidentally affecting our groups of interest. As stated in the main article, the sensitivity analyses did not affect our main conclusions. The inclusion of general moral concern as a control variable reduced the magnitude of the indirect effects in Study 1 by approximately one-third, rendering the indirect effects of the no-instructions versus perspective taking comparisons via self-other overlap on moral concern for all farmed animals and speciesism statistically nonsignificant. This suggests that part of the observed effects via this path could be explained by a general increase in moral concern, though this does not explain all of the effect. The inclusion of general moral concern as a control variable in Study 2 did not affect the magnitude or significance of the effects, suggesting that the observed findings were specific to artificial entities.

Second, we included personal distress as a third mediator in the models, alongside empathic concern and self-other overlap. Since our perspective taking manipulation was other-focused, encouraging participants to imagine the experience of another entity rather than imagining themselves in another entity's position, we did not expect to find an effect via personal distress (Batson et al., 1997). As expected, our experimental manipulation had no effect on personal distress, and there were no indirect effects of perspective taking on any of our outcome variables via this mediator. However, in Study 1, we found that the inclusion of personal distress resulted in a relatively large reduction in the size of the indirect effects on speciesism via empathic concern, but not for the other outcome variables of interest. This was because the effect of empathic concern on speciesism became nonsignificant when including personal distress, suggesting it may be a confounder of the initially observed relationship, which was correlational in nature. The inclusion

of personal distress also rendered the marginally significant indirect effect on speciesism via self-other overlap for the perspective taking versus no-instructions comparison marginally nonsignificant. In Study 2, we did not find a significant effect of the manipulation on personal distress, nor did we find any significant indirect effects via personal distress. However, consistent with the effects on speciesism in Study 1, we found that its inclusion rendered the indirect effect via empathic concern on substratism nonsignificant.

Third, since our hypothesized relationships between the mediators and dependent variables rely on correlational data, we estimated models that controlled for a range of potential confounders: age, gender, ethnicity, education, diet, pet ownership, political views, and personal distress. In Study 1, the inclusion of the control variables in the models reduced the size of the indirect effects by a relatively small amount compared to the models with just personal distress, additionally rendering two marginally significant effects nonsignificant: the indirect effect on moral concern for all farmed animals via self-other overlap for the perspective taking versus no-instructions contrast, and the indirect effect on speciesism via self-other overlap for the perspective taking versus stay-objective contrast. nonsignificant. In Study 2, the inclusion of the additional control variables had a small downward effect on the estimates, rendering the marginally significant indirect effect on substratism via self-other overlap for the perspective taking versus stay-objective comparison nonsignificant, but not affecting any of the other estimates.

The results for the mediation models for the stay-objective versus no-instructions comparisons were comparable in magnitude to the perspective taking versus no-instructions comparisons, supporting our conclusion that the effects can be explained by a combination of encouraging perspective taking and suppressing it. Note that, due to the bootstrapping procedure, some of the indirect effects for the no-instructions versus perspective taking comparisons reported in these models are slightly different to those in the main paper.

 196 *moral concern for emulations.*

	$\beta$	<i>SE</i>	<i>t</i>	<i>p</i>
DV: Empathic concern				
Intercept	0.000	0.060	0.000	1.000
Stay-objective	-0.100	0.069	-1.447	0.149
Perspective taking	0.069	0.069	0.996	0.320
DV: Self-other overlap				
Intercept	0.000	0.060	0.000	1.000
Stay-objective	-0.122	0.069	-1.763	0.079
Perspective taking	0.022	0.069	0.318	0.751
DV: Moral concern for emulations (direct effects)				
Intercept	0.000	0.046	0.000	1.000
Stay-objective	0.079	0.053	1.491	0.137
Perspective taking	-0.064	0.053	-1.223	0.223
Empathic concern	0.430	0.060	7.207	0.000
Self-other overlap	0.310	0.060	5.199	0.000
Personal distress	0.000	0.046	0.000	1.000
	0.079	0.053	1.491	0.137
DV: Moral concern for emulations (total effects)				
Intercept	0.000	0.061	0.000	1.000
Stay-objective	-0.002	0.070	-0.032	0.974
Perspective taking	-0.028	0.070	-0.397	0.691

197 *Note: Reference group in each case is no-instructions condition. Standardized effects reported. DV = dependent*  
 198 *variable.*

199  
 200 *Table S38. Study 2 Indirect effects – stay-objective versus no-instructions comparison – moral*  
 201 *concern for emulations.*

	$\beta$	<i>SE</i>	CI lower	CI upper
M: Empathic concern				
Stay-objective	-0.043	0.031	-0.107	0.015
Perspective taking	0.029	0.030	-0.029	0.091
M: Self-other overlap				
Stay-objective	-0.038	0.022	-0.085	0.003
Perspective taking	0.007	0.022	-0.036	0.053

202 *Note: Reference group in each case is perspective taking condition. Standardized effects reported. M = mediator.*  
 203

Table S39. Study 2 Mediation model results – stay-objective versus no-instructions comparison – substratism.

	$\beta$	SE	t	p
DV: Empathic concern				
Intercept	0.000	0.060	0.000	1.000
Stay-objective	-0.100	0.069	-1.447	0.149
Perspective taking	0.069	0.069	0.996	0.320
DV: Self-other overlap				
Intercept	0.000	0.060	0.000	1.000
Stay-objective	-0.122	0.069	-1.763	0.079
Perspective taking	0.022	0.069	0.318	0.751
DV: Substratism (direct effects)				
Intercept	0.000	0.052	0.000	1.000
Stay-objective	-0.058	0.060	-0.968	0.334
Perspective taking	-0.035	0.060	-0.587	0.558
Empathic concern	-0.255	0.068	-3.755	0.000
Self-other overlap	-0.329	0.068	-4.852	0.000
Personal distress	0.000	0.052	0.000	1.000
	-0.058	0.060	-0.968	0.334
DV: Substratism (total effects)				
Intercept	0.000	0.061	0.000	1.000
Stay-objective	0.008	0.070	0.109	0.913
Perspective taking	-0.060	0.070	-0.858	0.392

Note: Reference group in each case is no-instructions condition. Standardized effects reported. DV = dependent variable.

Table S40. Study 2 Indirect effects – stay-objective versus no-instructions comparison – substratism.

	$\beta$	SE	CI lower	CI upper
M: Empathic concern				
Stay-objective	0.026	0.019	-0.008	0.069
Perspective taking	-0.018	0.019	-0.060	0.018
M: Self-other overlap				
Stay-objective	0.040	0.025	-0.003	0.092
Perspective taking	-0.007	0.024	-0.055	0.042

Note: Reference group in each case is perspective taking condition. Standardized effects reported. M = mediator.
